Computer Vision

Make up Class 3 Assignment

1	Explain the fundamental concepts of edge, corner, line, and curve detection and discuss their importance in extracting meaningful features from images.
2	Explain SIFT, HOG, and Shape Context descriptors and discuss the type of visual information captured by each descriptor
3	Explain the working principles of active contours and morphological operations, including erosion, dilation, opening, and closing, with suitable examples.
4	Describe the split-and-merge and watershed segmentation techniques and explain their working using suitable examples or diagrams.
5	Analyze and compare graph-based segmentation, mean-shift segmentation, and normalized-cut segmentation with respect to their principles, region formation, advantages, and limitations.
