Computer Vision

Make up Class 4 Assignment

1	Define edge detection and state its significance in computer vision.
2	List the major characteristics of SIFT and HOG descriptors used for feature representation.
3	Explain the working principle of Harris corner detection and its usefulness in feature extraction.
4	Describe the split-and-merge approach used for image segmentation.
5	Analyze the differences between watershed, graph-based segmentation, and normalized-cut segmentation in terms of their basic segmentation principles.
